

Testing Strategy for Long-Term Care Facilities in Idaho Updated June 15, 2022

This document summarizes recommendations for COVID-19 viral testing for residents and healthcare personnel (HCP) in long-term care (LTC) facilities.

As used in this document, the term “long-term care facilities” refers to assisted living facilities and intermediate care facilities for individuals with intellectual disabilities (ICF/IID). Nursing homes should follow [CMS requirements](#) for long-term care facility testing.

Infection Prevention and Control

Testing is just one part of an effective infection prevention and control strategy.* Residents of LTC facilities are at high risk of acquiring and experiencing severe complications of COVID-19, including death. LTC facilities should have in place a robust infection prevention and control plan as outlined in the CDC’s [Interim Infection Prevention and Control Recommendations to Prevent SARS-CoV-2 Spread in Nursing Homes](#) and should include protocols to screen for signs and symptoms of COVID-19 in all HCP, residents, and visitors.

In addition, LTC facilities should have a plan to rapidly initiate testing and implement enhanced infection prevention and control measures if COVID-19 is suspected. A point of contact at the local public health department should be identified, and a relationship with that point of contact should be established.

Definitions

“Up to date” on COVID-19 vaccination means a person has received all recommended COVID-19 vaccines, including any recommended booster dose(s) when eligible.

“Outbreak” means at least one facility-acquired COVID-19 infection in a resident or 2 or more COVID-19 infections in healthcare personnel who worked in the facility during their exposure or infectious period.

“Facility-acquired” means COVID-19 infection in a long-term care resident with a confirmed diagnosis 14 days or more after admission for a non-COVID condition, without an exposure during the previous 14 days to another setting where an outbreak was known or suspected to be occurring.

“Healthcare personnel (HCP)” include, but are not limited to, direct care staff as well as persons not directly involved in patient care (e.g., clerical, dietary, environmental services, laundry, security, engineering and facilities management, administrative, billing, consultants, vendors, and volunteer personnel).

“Close contact” is being within 6 feet of a person infected with SARS-CoV-2 for a cumulative total of 15 minutes or more over a 24-hour period.

“Higher-risk exposure for HCP” means HCP were in close contact with a SARS-CoV-2 infected person and:

- HCP were not wearing a respirator (or if wearing facemask, the person with SARS-CoV-2 infection was not wearing a cloth mask or facemask)
OR
- HCP were not wearing eye protection, and the person with SARS-CoV-2 infection was not wearing a facemask or cloth mask
OR

- HCP were not wearing full PPE (i.e., N95, eye protection, gloves and gown) during the performance of an [aerosol generating procedure](#) (such as a nebulizer treatments or non-invasive ventilation (e.g., CPAP/BiPAP)).

Key Points for Testing

- Laboratories that are selected to process the specimens from LTC facilities must have a rapid (e.g., less than 2 days) turn-around time.
- Laboratories must be notified in advance of sending specimens about the need to expedite and prioritize testing of both LTC facility residents and HCP.
- RT-PCR tests are generally preferred over point-of-care rapid antigen testing in the LTC facility setting. See “Rapid Antigen Testing” section, below, for some exceptions.
- All positive test results must be reported to the LTC facility’s local public health district.
- All discordant test results (e.g., a positive test result and a negative test result in the same individual) should be discussed with the local public health district. Facilities should not make determinations of “false positive” results without discussing with their local public health district.
- HCP and residents who have recovered from COVID-19 infection and are asymptomatic do not need to be retested for COVID-19 within 90 days as part of screening testing, exposure testing, or outbreak testing, unless they develop symptoms consistent with COVID-19. If testing is performed on these people within 90 days, an antigen test instead of a nucleic acid amplification test (NAAT) is recommended. This is because some people may remain NAAT positive but not be infectious during this period.
- Antibody (or serology) testing is not included in this document as it is not currently recommended for clinical decision-making or occupational health considerations in LTC facilities.

Trigger-based Diagnostic Testing

The table below lists situations or circumstances in which diagnostic SARS-CoV-2 viral testing should be performed.

Testing Trigger	HCP	Residents
Symptomatic individual identified	All HCP, regardless of their vaccination status, with signs or symptoms of COVID-19 must be tested as soon as symptoms are identified.	All residents, regardless of their vaccination status, with signs or symptoms of COVID-19 must be tested as soon as symptoms are identified.
Newly identified COVID-19 positive HCP or resident	<p>Test all HCP, regardless of their vaccination status, facility-wide.</p> <p>Test individuals immediately and, if negative, every 3-7 days until there are no positive cases identified for 14 days.</p> <p>In rare cases, public health districts may recommend more limited testing.</p>	<p>Test all residents, regardless of their vaccination status, facility-wide.</p> <p>Test individuals immediately and, if negative, every 3-7 days until there are no positive cases identified for 14 days.</p> <p>In rare cases, public health districts may recommend more limited testing.</p>
Asymptomatic HCP with a higher-risk exposure and residents with close contact	<p>Test HCP who are up to date with all recommended COVID-19 vaccine doses and have NOT recovered from a SARS-CoV-2 infection in the prior 90 days immediately (but not earlier than 24 hours after exposure) and, if negative, again 5-7 days after exposure.</p> <p>See CDC guidance for management of exposed HCP, including HCP who have recovered from SARS-CoV-2 infection in the prior 90 days or who are not up to date with all recommended COVID-19 vaccine doses.</p>	<p>Regardless of vaccination status, test immediately (but not earlier than 24 hours after exposure) and, if negative, again 5-7 days after exposure.</p> <p>See assisted living facility Guidance Checklist for management of exposed residents.</p>

Routine Screening Testing

LTC facilities should test asymptomatic HCP at a regular interval based on the extent of the SARS-CoV-2 transmission in the community.

- Asymptomatic, HCP who are up to date with all recommended COVID-19 vaccine doses do not need to undergo this screening testing.
- Screening testing frequency should be based on the county level of community transmission of COVID-19.
- For level of community transmission by county, see CDC's [COVID Data Tracker](#).
- LTC facilities should monitor their level of county transmission every other week and begin testing HCP at the frequency shown in the table below as soon as criteria for more frequent testing are met.
- If the county transmission level decreases to a lower level of activity, the LTC facility should continue testing at the higher frequency level until the county transmission level has remained at the lower level for at least two weeks before reducing the testing frequency.
- LTC facilities may want to consider more frequent testing if there are factors that suggest a higher risk of disease activity, such as HCP who live or also work in counties that have higher levels of community transmission.

- If HCP work infrequently, they should be tested within 3 days before their shift.

Level of COVID-19 Community Transmission	Minimum testing frequency of staff who are not up to date with COVID-19 vaccines
Low (blue)	Not recommended
Moderate (yellow)	Once a week
Substantial (orange)	Twice weekly
High (red)	Twice weekly

Rapid Antigen Testing

- RT-PCR tests are generally preferred over point-of-care rapid antigen testing in the LTC facility setting. However, point-of-care rapid antigen testing may be useful in some circumstances, such as for symptomatic individuals with a known exposure, for which an immediate test result may help inform clinical or infection control decisions. Facilities that choose to use point-of-care antigen tests must ensure they have the appropriate [CLIA Certificate of Waiver](#), have been trained in how to perform the tests, are familiar with the [CDC guidance](#) on antigen testing in LTC facilities, and understand requirements for reporting results to public health authorities.
- If based on [CDC guidance](#), rapid antigen tests may sometimes be used for return-to-work decisions.
- All positive facility-performed rapid antigen test results need to be submitted to the Idaho Department of Health and Welfare Division of Public Health. Contact epimail@dhw.idaho.gov for instructions.
- All positive facility-performed rapid antigen test results must be reported to the local public health district.
- Any positive at-home rapid antigen tests performed by HCP and reported to facility administrators should be considered a COVID-19 infection for infection control and outbreak purposes. These positive test results should be reported to the local health district but do not need to be submitted to the Idaho Department of Health and Welfare.
- Follow the [Guidance Checklist](#) for management of residents and HCP with symptoms consistent with COVID-19 or if exposed to someone with COVID-19.

*This document does not address symptom and temperature monitoring, quarantine and isolation, work restriction, and other infection control and prevention measures, including use of personal protective equipment (PPE), which are all important components of minimizing and controlling the spread of COVID-19 in long-term care facilities and protecting the health and safety of residents, HCP, and visitors.
